

Rethinking Contract Structure for Human + AI Understanding

FROM STORAGE HIERARCHY → RELATIONSHIP-DRIVEN SYSTEM

“One simple question users can’t answer today”

Which amendment **applies** to
this SOW?

Today, contract meaning is trapped inside folders

Users are trying to answer:

- What governs this?
- What modifies this?
- What applies here?

So they rely on:

- Folder placement
- File names
- Notes
- Memory

CURRENT DESIGN SCREENSHOT

We can changed one fundamental thing

From Folders (storage) To Relationships (meaning)

FOLDERS / FILES

Meaning must be inferred

RELATIONSHIPS

Meaning is explicit

AFTER REDESIGN

Same question. Instant answer

Start from SOW

- See:
- Governing MSA
 - Applied amendments
 - Supporting evidence is documents

Primary Agreement

Main agreement for this contract structure

1 Governing Agreement

CO0234 - Master Service Agreement.

Active • Effective: 01 Jan 2024 • Expiring in: 238 days

Governs: 540 SOWs 5 Amendments

Amendments

Updates that modify this agreement

5 Amendments

Execution Agreements

Statements of Work operating under governing agreement

540 SOWs

Filter By

Active

Has open disputes

Expiring < 30 days

Clear filters

CO9142 - SOW – Boston Mobile Platform Modernization

Active • Aug 2024 – Jul 2025 • North America

TCV : \$ 1.0M
Amendment : 1

CO9143 - SOW – New York Data Integration Project

Active • Sep 2024 – May 2025 • North America 3 Documents

TCV : \$ 750K
Amendment : 0

CO9144 - SOW – Chicago Cloud Migration Initiative

Pending • Oct 2024 – Mar 2025 • North America

CO9144 - SOW – APAC Managed Services Expansion

Completed • Sep 2024 – Aug 2024 • APAC

Amendment : 2

535 More Agreements

Governing MSA

CO0234 - MSA Service Agreeeme...

Applied Amendments

CO3432 - Amendment 1

Work Orders

Operational execution units issued under approved SOWs

120 Work Orders

Related Agreements

Independent agreements connected to this contract

3 Agreements

RELATIONSHIPS

Meaning is explicit

And these
relationships define
the actual structure
of the contract

Users are already recreating contract relationships manually

- SHARED BY MADHUR - FOR MORGAN STANLY

OBSERVED WORKAROUNDS IN CURRENT SYSTEM

Users infer legal relationships by navigating folders

Folder structure shows files, not legal meaning

→ What applies or modifies remains unclear

Reconstructing relationships in notes

Users manually document what modifies what.

→ Because the system doesn't track it - they got created custom field called notes

Encoding meaning in file names

File names become the source of truth for version, status, and authority.

The language we use reveals the model we are in

Today, the same problem is described through different system lenses — storage, hierarchy, mapping, and browsing. But the user need is relationship understanding.

Current language

- Folder
- Doc tree
- Parent-child mapping
- Contract family
- Contract browser
- Storage hierarchy

What this language implies

- Where is the file stored?
- What is nested under what?
- Which record is parent/child?
- Which documents belong together?
- How do I browse the repository?

New language

- Contract Relationship Intelligence

What this enables

- What governs what?
- What modifies what?
- What applies here?
- What is impacted?
- What should AI reason over?

The opportunity

Make Sirion the system that understands contract relationships — not just stores contract documents.

Design Principle

Structure → surfaces authority
relationships for quick scanning
(who governs what)

MSA → SOW → WO

Relationships → show impact
(what modifies what)

Parent, modifies, applies to, supersedes.

Documents → provide evidence
(supporting proof)

Contextual files. Not structural authority.

Make the governing agreement the anchor

- Single primary legal backbone.
- Always visible.
- Never buried in folders.
- Displays effective date and status etc

MNTC Corp Pvt Ltd

Primary Agreement

Main agreement for this contract structure

1 Governing Agreement

Where market is going

Sirion → structure + AI

SIRION REDESIGN

A well-designed room.
Everything is already in the
right place.

Structure enables AI — not the reverse

Structure is usable by AI for reasoning

Stakeholders are saying the same thing

Customer Success

Madhur Lakhanpal
Senior Director – Consulting Services

“Contracts are understood through what governs what not through files. That clarity is missing today.”

Legal SME

Sumbul Ahmad
Senior Manager -Legal Engineering

“The structure should clearly communicate agreements, documents, and their relationships today, that clarity is missing”

Product / UX Review

Anshul Sharma
Vice President-Standards and Processes

“Amendments are often placed under SOWs, but they actually impact the MSA this mismatch creates confusion.”

PERs:

From User Pain to System Design

PER ID	Pain Point	Design Response	Impact
PER-3956	Users relied on folders to understand contracts → causing confusion & wrong grouping	Replaced folders with true legal entities (MSA, SOW, Amendments)	✔ Core redesign
PER-3493	Legal teams couldn't reorganize documents without breaking structure	Allowed bulk document actions within evidence layer only	● Evidence layer
PER-4641	Obligation counts felt unreliable → users didn't trust numbers	Aligned counts with user scope + added clarity labels	● Trust layer
PER-4715	Users saw wrong version (OCR vs executed) by default	Prioritized executed document as default view	● Viewer layer
PER-4821	Filters behaved inconsistently across modules → broke mental model	Scoped filters independently per module	● Listing behavior
PER-4637	Users couldn't clearly identify contracts in structure	Introduced clear contract ID visibility in nodes	✔ Structural clarity
PER-4508	Editing rights unclear → risk of unintended changes	Separated repository edit from metadata edit permissions	● Permission layer
PER-4786	CO vs FO confusion → entities looked visually similar	Reinforced clear entity distinction in listing	● Listing clarity
PER-4815	Users created inconsistent contract types → messy system over time	Introduced admin-controlled contract taxonomy	● Governance layer
PER-4787	Counterparty selection resets on contract switch → breaks user context in multi-party contract navigation	Maintain counterparty as a persistent context across document tree navigation	● Multi-dimensional navigation

From SC feedback sheet

Row	Core Problem	What it really means	Your Design Decision	Quote (Actual feedback)	Source
19	Folder confusion	Users don't understand structure → default to folders	Replace folders with legal entities (MSA, SOW, Amendments)	"Users want simple folders... current blue folders are too complex"	Adrien
20	Need for simple organization	Users want predictable, familiar grouping	Metadata-driven structure + templates (not manual folders)	"Requests a simple tree view... familiar structure... templatizable folders"	Adrien
25	Broken interaction	Tree loses context on click	Right-side preview, no full refresh	"Clicking a document causes a full page refresh... clunky and confusing"	Adrien
52	Weak visual hierarchy	Parent-child relationship not felt	Strengthen grouping + proximity (parent-child clarity)	"Group files closer to their parent... too much whitespace"	Lindsay

Thanks

Amrit Kumar
